Chapter 12 Developing a Theoretical Framework and Rationale for a Research Proposal

Gregory M. Hawk

All empirical research is based on assumptions. Even purely "descriptive" or "exploratory" studies necessarily involve choices about the phenomena and variables to observe and the level of detail at which to observe them. Researchers planning an empirical study confront the challenges of making these assumptions explicit, examining them critically, and designing the investigation to yield data that permit those assumptions to be evaluated and modified appropriately.

This is the process of theory construction. Unfortunately, although all research is based on theory, many grant proposals lack a well-developed theoretical rationale. The theoretical framework often remains implicit in the proposal without being formally articulated. Consequently, even though the application may be based on a good idea, it is conceptually weak and receives a poor priority score.

12.1 The Rationale for Theory Construction and Testing

Whether explicitly stated or not, a researcher's theory guides every aspect of her or his research from formulation of the initial research question, through defining and operationalizing variables, to interpreting results. Clearly articulating your theoretical assumptions strengthens your research significantly for at least four reasons.

First, explicitly stating the theoretical assumptions permits them to be evaluated critically. You can identify important omissions and assess whether undue emphasis is being placed on a particular type of variable or relationship.

Second, the theoretical framework connects you to existing knowledge. When guided by relevant theory, investigators need not start each study from scratch. They can build on others' work (including, perhaps, research from domains
